GÜHRING HIGH-PERFORMANCE TOOLS FOR
MACHINING FIBRE COMPOSITE MATERIALS

- without fraying of fibres and delamination
- for optimal component surface finish quality

Machining modern composite materials

GÜHRING – YOUR WORLDWIDE PARTNER

Pictograms

Tool material	VHM PKD	
	Solid carbide Polycrystalline diamond	
Surface finish		
	bright TiCN Cristall	
Ø-tolerance	e10 h6 h7 h8 m7	
Shank form	HA Cyl	
	to DIN 6535	
Standard	DIN 6539 ~DIN 371 DIN 371 WN	
	to Guhring std.	
Type	H N NR15 W FK CR 100 FR 100 TM SP MTM3 SP	
Form	C D	
Hole type		
	Through holes and blind holes	
Cutting direction		
	right-hand	
Applications		
	slotting roughing ramping Helix drilling finishing copying	
Lenght		
	long (DIN) medium length	
No. of cutting edges		
	no. of cutting lips	
Web thinning		
Helix angle		
	size of helix angle / no. of different helix angles	
Rake angle		
	rake angle of circumferential cutting edges	
Infeed		
	for lateral infeed for lateral infeed and ramping for lateral infeed, ramping and drilling	
Point angle		
	90° 120°	

MACHINING MODERN COMPOSITE MATERIALS

Modern fibre reinforced plastics (FRP's) are making an entry into a broad range of industrial applications for reasons of efficiency, weight reduction, strength and dynamics. With their specific properties they extend the group of conventional metal lightweight construction materials such as aluminium- and titanium-alloys. FRP's or multi-material combinations, ie. a mixture of FRP and metallic materials, are therefore no longer exclusively retained for the aerospace industry, motorsport and other high-end applications. It is especially worth highlighting the great growth in the general automotive and commercial vehicle technology.

FRP's are applied where high specific strength and low weight as well as high dynamic or energy efficient processes can be found. For the machining of CFRP, GFRP and stacks (FRP-metal-layer composite) without component damage, cutting edge quality and wear resistance of the tool material are of absolute importance. Guhring provides special solid carbide, coated carbide and PCD tooling solutions for these demanding materials. They are specially adapted to the respective material structure and ensure optimum chip evacuation as well as uniform hole diameters across all materials.

CHALLENGES

- components without fraying of fibres
- delamination-free component surface finish
- no component damage through "peel-up" or "push-out"
- prevention of split fibres on component
- minimising burr development
- prevention of thermal damage

TOOLS

PCD 

RESULT OF A DRILLING OPERATION WITH SPECIALISED GUHRING TOOLING SOLUTIONS

Machining with a Guhring tool retains the structure and direction of the fibres in the component, as the REM examination shows. The fibres are neither pressed into the matrix nor ripped out of the composite.

CFRP cut surface with 500-fold magnification

Optimal machining results in CFRP

no peel-up – no push-out

hole exit in CFRP
with woven cover layer
hole $d = 6.35$ mm

CNC Gühro ThreadMill

Free programming software

for thread milling cutters and drill thread milling cutters

In order to make the machining with Gühring thread milling cutters even more user friendly, we have developed the intuitive “CNC Gühro Thread Mill”.

“CNC Gühro Thread Mill” is available free-of-charge. Simply download it from our homepage www.guehring.de.

To the optimal CNC programme in five steps

1. Specify the thread data
Select from all current thread standards
2. Select the material
You are always referred to the optimal parameters
3. Select the tool
Technical data, drawing, machining time and video simplify selection
4. Record CNC data
Enter required milling strategy and parameters
5. Receive CNC programme with code and data sheet
Programming data (Sinumerik, Haidenhain, Fanuc, Philips, Mazatrol or Hurco) are imported and automatically recognised

Difference between taps/fluteless taps and thread milling cutters

Taps/fluteless taps

The red lines show the pitch angle of the thread that is ground into the tool. This means the pitch is cut into the workpiece by the tool.

Thread milling cutter

The red lines show that the tool does not possess a pitch angle. The pitch is produced by the Z-axis of a CNC machine.

Creation of the thread with thread milling

Thread profile without axial feed (Z-axis) of the machine. A groove profile is created without pitch. A functioning thread is not created.

Through the additional programming of the Z-axis the necessary pitch is produced.

Note:

Due to diagonal milling in the pitch angle (**Z-axis**) the thread profile of the tool is **transferred onto the component distorted**.

The more the milling cutter diameter (80 % of nom. Ø) approaches the nominal thread diameter and the higher the thread pitch the more pronounced the profile distortion is.

Differentiating between two milling processes

Reverse rotation milling

clockwise, with G02

Reverse rotation milling is preferentially applied for the machining of harder materials or to remedy taper threads.

Synchronous milling

anticlockwise, with G03

Synchronous milling is applied with thread depths smaller than $1.5 \times D$.
Advantage: A better surface finish is achieved.

Thread production with one tool

Right-hand thread

Reverse rotation milling

Tool rotates clockwise from top to bottom

Left-hand thread

Reverse rotation milling

Tool rotates clockwise from bottom to top

Right-hand thread

Synchronous milling

Tool rotates clockwise from bottom to top

Left-hand thread

Synchronous milling

Tool rotates clockwise from top to bottom

Program specifications

Thread milling functions

G00 Rapid movement	G90 Absolute dimension
G01 Feed	G91 Incremental dimension
G02 Circular interpolation (clockwise)	M03 Spindle on (clockwise rotation)
G03 Circular interpolation (anti-clockwise)	M05 Spindle stop
G17 Layer selection x-y axis	M08 Coolant on
G18 Layer selection z-x axis	X Axis
G19 Layer selection y-z axis	Y Axis
G40 Cancel tool correction	Z Axis
G41 Tool path correction (left of contour)	I Thread pitch parallel to X-axis
G42 Tool path correction (right of contour)	J Thread pitch parallel to Y-axis
G43 Tool length compensation (call-up)	S Spindle speed
G49 Tool length compensation (deselect)	F Feed
G54 Work offset	

CNC internal thread milling

1. Moving to start position
2. Moving to thread depth in bore
3. 180° descending loop to contour
4. 360° full circular movement of thread milling cutter
5. 180° exit loop to centre of bore
6. Rapid movement from bore to start position

Formula of calculation

$$v_c = \frac{d \cdot \pi \cdot n}{1000}$$

$$n = \frac{v_c \cdot 1000}{d \cdot \pi}$$

$$v_f = n \cdot z \cdot f_z$$

$$v_m = \frac{v_f \cdot (D - d)}{D}$$

$$v_b = n \cdot f_b$$

v_c = cutting speed
 v_f = contour feed
 v_m = centre point path feed
 n = revolutions
 z = number of teeth
 f_z = feed per tooth
 f_b = feed per drill per revolution*
 v_b = drill feed rate*
 D = Ø nom. of thread [mm]
 d = milling cutter nom. Ø [mm]
 * for drill/thread milling

Thread milling programming

Programming process for micro-thread milling (right-hand thread in reverse rotation)

Possibilities to reduce radial forces

To reduce radial forces cut distribution can be undertaken:

Advantage:

- for larger thread depths
- counteracts taper threads
- for unstable clamping conditions

Disadvantage:

- increased tool wear
- longer production time

Axial distribution of cut

Radial distribution of cut

Practical application of thread milling cutters

1.) Tool clamping:

good concentricity is important, therefore clamping as short and rigid as possible

2.) Enter tool data in machine memory

- 1.) Tool length from the front face, take drill/thread milling cutters (DTMC) from point.
- 2.) Measure tool radius with tool pre-setting equipment. General rule:
measured radius - $0.022 \times \text{pitch}$ provides the input value in machine memory.

3.) Input of CNC program in control

(preferably integrated as sub-program at corresponding positions)

- a.) Call-up of a self-controlling cycle (procedures should be known)
- b.) Integration of data file from our threadmill-software (DIN or Haidenhain).

4.) Trial run over workpiece

- a) Tool length dimension in memory extending by an approximate value dependent on contact length (i.e. 30 mm) or offset zero point.
- b) Run program in single set, visual check of travel path.
- c) Allow program to run in automatic mode.

Attention:

With controls where it is not definitely clear what milling path is assigned it must be clarified if the feed is positioned on the external path v_f or at the centre path v_m . As a rule we specify the milling centre point path v_m .

5.) Application in workpiece

Re-set the tool extension or the zero point. Then allow the program to run in the workpiece the feed regulation must be 100 % selected. Should the thread not be true to gauge, the tool radius requires correction in the tool memory:

Example:

- thread too tight: Radius correction - input
- thread too large: Radius correction + input

Notes

This image shows a full page of blank graph paper. The grid consists of thin, light gray horizontal and vertical lines that intersect to form small squares across the entire surface. There are no margins, text, or other markings on the paper.
